CLAIMS

What is claimed is:

1. A securing device comprising:

a rigid shank having a first end and a second end;

threads disposed at the first end of the shank for use in securing the device to a pole;

a rigid first support member disposed on the second end of the shank for securing a first object to the pole; and

a rigid second support member disposed on the second end of the shank for securing a second object to the pole.

2. The device of claim 1, wherein the shank, first support member and second support member are disposed in the same plane.

3. The device of claim 1, wherein the first support member and the shank are located in the same plane.

4. The device of claim 1, wherein the shank and second support member are located in the same plane.

5. The device of claim 1, wherein the first and second support members are located in different planes.

6. The device of claim 1, wherein the shank and first support member form a P shape.

7. The device of claim 1, wherein the shank and second support member form a J shape.

8. The device of claim 4, wherein the shank and second support member form a P shape.

9. The device of claim 4, wherein the shank and the first support member form a P shape and the shank and second support member for a J shape.

10. A method for manufacturing a support device, the method comprising:

dividing a first end of a metal shank to create a first end portion and a second end portion;

creating a first support member by bending said first end portion initially perpendicularly and then radially away from said metal shank;

creating a second support member by bending said second end portion initially perpendicularly and then radially away from said metal shank in a direction approximately opposite that of said first support member.

11. The method of claim 10, further comprising affixing a securing means to a second end of said metal shank opposite said first end.

12. The method of claim 10, wherein dividing comprises cutting a portion of said metal shank in approximately half along its longitudinal axis.

13. The method of claim 10 wherein the shank, first support member and second support member are disposed in the same plane.

14. The method of claim 10, wherein the first support member is bent out of the plane of the shank.

15. The method of claim 10, wherein the second support member is bent out of the plane of the shank.

16. The method of claim 10, wherein the first and second support members are nonplanar with the shank.

17. A securing device comprising:

a rigid shank having a first and second end;

means for securing the device to a pole disposed at the first end of the shank;

first support means disposed on the second end of the shank for securing a first object to the pole; and

second support means disposed on the second end of the shank for securing a second object to the pole.

18. The device of claim 17, wherein said first and second support means are co-planar.

19. The device of claim 17, wherein said first and second support means are non-planar.

20. The device of claim 17, wherein the first and second support means are rigid.
